Coil packing machine

- » Steel coil packing machine
- » Wire coil packing machine
- » Copper coil packing machine
- » Hose packing machine
- » Tyre packing machine
- » Pipe packing machine
- » Cable packing machine

Stretch Wrapping Machine

- » Pallet wrapping machine
- » Automatic wrapping machine
- » Rotary arm wrapping machine

Horizontal Wrapping Machine

- » Pipe wrapping machine
- » Rod wrapping machine
- » Aluminum wrapping machine
- » Profile wrapping machine

Shrinking Machine

- » Door packing machine
- » Box shrinking machine
- » Board shrinking machine

Coil Upender

Coil Packing Machine

Coil packing machine is a efficient equipments for coil packaging, It can finishes a eye cross packaging during 30-40sec . The speed of ring and rollers are adjustable to accommodate materials varying in thickness. The conveyor belt can be raised or lowered and in some models, even tilted to the desired angle. It is equipped with an imprinter, or an ink coding system to record words, dates, and codes with each seal. Band Sealers speeds are considerably faster than intermittent types of sealing, it is ideal for projects which require higher production rates and minimal space and costs.

The package concept is an integral part of the coil packing machine design. The machine puts a tight layer of film over all surfaces of the coil. This tight layer of film eliminates most of the air from the package. By reducing the amount of air in the package, the potential for moisture to form is reduced, thereby reducing the possibility of corrosion or water spots.

The ancillary packaging is then applied. This packaging may include inside diameter protectors, outside diameter protectors, side wall protectors or belly wrap material. This material can be applied manually or its application can be integrated into the system to be applied automatically. This ancillary packaging protects both the coil and the first layer of film The ancillary product can be made from plastics to maintain a completely recyclable package.

A second layer of film is then applied. The second layer of film holds the ancillary package in place and further protects the inner airtight layer of film. Since the two layers are applied separately and the ancillary material is in between, the outer layer may be torn from handling damage but the inner layer remains intact and thus the coil stays sealed and protected Also, since the. first layer of film is tight if, any condensation forms, it is either between the layers or on the outside layer. In either case, the moisture does not penetrate through the first layer. Also, since the entire coil is sealed in a waterproof package, any external moisture runs off the package.

From coil packing machines, through coil wrapping machines to relating packaging films, Fhope offers a wide variety of packaging equipment that covers a broad range of coil object.

Browse our entire range of solutions by selecting the areas that are right for you.

By machine - Coil Wrapping Machine or Coil Packing Machine

Find the right solution to fit your needs by selecting the type of machine you are interested in.

By industry

Find the right solution to your packaging needs by selecting your industry/market segment.
